PRAI US 2000-689013	A	20001012		
AB A compn. for treating a substrate, to make it oil and water repellent , comprises a homogeneous mixt. of: (a) a fluorinated polyether silane of the formula, Rf1-[-Q-SiY3-xR1x]y (I), where Rf1 represents a monovalent or divalent polyfluoropolyether group, Q represents an org. divalent linking group, R1 represents a C1-C4 alkyl group, Y represents a hydrolyzable group; x is 0 or 1 and y is 1 or 2; (b) an org. or an inorg. acid; (c) water and (d) an org. solvent. A method of making such a compn. and the use to treat substrates, such as ceramics and glass, to render them oil and water repellent are described.

AB This invention relates to chem. compns. comprising .gtoreq.1 urethaneoligomers of .gtoreq.2 repeating units selected from the group consisting of F-contg. **urethane oligomers** and long-chain hydrocarbon-contg. **urethane oligomers**. These **urethane oligomers** comprise the reaction product of (a) .gtoreq.1 polyfunctional isocyanate compds., (b) .gtoreq.1 polyols, (c) .gtoreq.1 monoalcs. selected from the group consisting of fluorochem. monoalcs., optionally substituted long-chain hydrocarbon monoalcs., and mixts., (d) .gtoreq.1 silanes; and optionally (e) .gtoreq.1 water-solubilizing compds. comprising .gtoreq.1 water-solubilizing groups and .gtoreq.1 isocyanate-reactive H contg. group. The chem. compns. can be applied as **coatings** and these **coatings** can impart stain-release characteristics and resist being worn-off due to wear and

abrasion. The water-sol. N-3300-C4F9SO2N(CH2CH2OH)2-glycolic acid-3-aminopropyltriethoxysilane condensate methyldiethanolamine salt form was **coated** as a 3% soln. on slate tile; showing excellent stain resistance to grape juice, transmission fluid, motor oil, wine, coffee, brake fluid, and corn oil.

IT **400782-26-5DP**, reaction products with fluoroalc. or hydrocarbon alc. **400782-27-6DP**, reaction products with fluoroalc. or hydrocarbon alc.

 AB Fluorinated **oligourethanes**, having no. av. mol. wt. lower than
 or equal to 9,000 and a branched structure, are formed of the following
 monomers and macromers: (a) aliph., cycloaliph. or arom. polyisocyanates,
 (b) $XO(CR_1AR_2A)bY_0$ [R_1A , R_2A = H or C1-10 aliph. radical; b = 1-20; XO =
 OH or SH; Y_0 = anionic or cationic salifiable function or when XO = OH, b
 = 1, R_1A = R_2A = H, and Y_0 = $CH_2O(CH_2CH_2O)_nMe$, n = 3-20]; one or more of
 the following compds.: (c) bifunctional hydroxyl (per)fluoropolyethers
 (PFPE diols) having no. av. mol. wt. in the range 400-3,000, (e)
 monofunctional hydroxyl (per)fluoropolyethers or monofunctional hydroxyl
 (per)fluoroalkanes (e'), having no. av. mol. wt. in the range 300-1,000;
 and, optionally, the following compds.: (d) $XO(CR_1AR_2A)bY_0$ (R_1A , R_2A , b ,
 and XO = same as above; Y_0 = oxiranyl, $OCOR_1BC:CH_2$, $Si(OR_x)_3$, $CH_2CH:CH_2$,
 or $OCH:CH_2$; R_1B = H or Me; R_x = C1-5 alkyl); (d1) hydrogen-active compds.,
 capable to form bonds with the NCO functions stable at the hydrolysis but
 weak at heat. These **oligourethanes** are useful as **water**
 - and **oil-repellent coatings** for substrates
 with high porosity. A typical IPDI-based **oligourethane** was
 manufd. by stirring a soln. contg. 45 g Vestanat T1890, 51 g EtOAc, 6.189
 g dimethylaminopropanol, 0.6 mL 20% Fascat 4224 soln. 1 h at 70.degree.,
 adding 240 g EtOAc and 68.1 g $HOCH_2CF_2O(CF_2CF_2O)_p(CF_2O)_qCF_2CH_2OH$ (p/q =
 2.2) and heating 8 h at reflux.

AB	A lubricant comprises .gtoreq.1 polyether and .gtoreq.1 surfactant , in which the surface tension at 100.degree., T100 (mN/m), and the percentage of residues resulting from heating at 500.degree., Re (%), satisfy the relations Re .ltoreq. 5.5 - 0.25T100, 10 .ltoreq. T100 .ltoreq. 22, and 0 .ltoreq. Re .ltoreq. 1. Thus, a lubricant contained a base oil 100, Me methacrylate-perfluorooctylethyl acrylate-polyethylene propylene glycol monoacrylate copolymer 0.05, Na C14-16 alkanesulfonate 0.5, and K polyethylene glycol isostearyl ether phosphate 0.5 part, and the base oil contained polyethylene propylene glycol Bu ether 60, block polyethylene propylene glycol lauryl ether 20, polyethylene propylene glycol 10, and polyethylene glycol laurate 10 parts.				
IT	52550-45-5 , Polyethylene glycol N-perfluorooctylsulfonyl-N-propylaminoethanol ether 75587-26-7D , Polyethylene glycol-4,4',4"-triphenylmethane triisocyanate copolymer, reaction products

AB The graft polymers are manufd. by copolyng. (A) radically polymerizable monomers and (B) macromers which have radically polymerizable terminal on 1 end and total methacrylate-type monomer content .gtoreq.70%, and are composed of (a) perfluoroalkyl (meth)acrylates 20-65, (b) alkyl (meth)acrylates 25-80, and (c) .gtoreq.1 monomer selected from hydroxyalkyl (meth)acrylates and polyalkylene glycol mono(meth)acrylates 0-10%. Thus, polyng. perfluorooctylethyl methacrylate 30, Me methacrylate 50, and iso-Bu methacrylate at 90.degree. in MIBK in the presence of mercaptopropionic acid and 2,2'-azobis(2-methylbutyronitrile), adding 2.7 g glycidyl methacrylate to the reactor with hydroquinone monomethyl ether, Bu4NBr, and MIBK, and reacting while blowing air at 90.degree. gave a macromer with no.-av. mol. wt. (Mn) 6000, 5 parts of which was reacted with hydroxyethyl methacrylate 13, acrylic acid 2, styrene 30, and Bu methacrylate 50 parts in BuOAc-xylene mixt. in the presence of 2,2'-azobis(dimethylvaleronitrile) to give a graft copolymer with Mn 8000. A 40%-solid **coating** contg. the graft copolymer soln., a HMDI-type polyisocyanate, dibutyltin dilaurate, and MIBK was applied onto

Al plate and cured at 25.degree. for a week to give test pieces showing good gloss and **resistance** to **water**, **oil**, staining, and weather.

OS MARPAT 120:136059

AB The title compds. comprise a mixt. of straight and branched perfluoroalkyl groups bonded to Cl, Br, or I through a F-free alkylene group. Perfluorodecyltetrahydroiodide (prepd. from perfluorosulfonyl fluoride, 40% straight and 60% branched, treated first with I, then with C₂H₄) was derivatized to thiol functionality by treatment with thiourea in EtOH to give perfluorodecyltetrahydrothiol (I). I was added to a reaction mixt. contg. hexamethoxymethylmelamine to give a I-melamine condensate (II, 1:4 mol ratio). A 50/50 polyester/cotton fabric blend was treated with an emulsion of II at 0.3%, dried and cured at 150.degree., to give a fabric with **oil resistance** (AATCC 118-1975) 5 and 5 after 1 dry cleaning, vs. 3 and 2, resp., for a precursor perfluorodecyltetrahydroiodide having all straight chain perfluoroalkyl groups.

AB Polyurethanes having pendant perfluoroalkyl groups show excellent
 toughness, **water** and **oil repellence**,
 abrasion **resistance**, and low **surface** energy. Thus, a
 30% DMF soln. of C8F17SO2N(CH2CH2OH)2 (I) 0.15, poly(oxytetramethylene)
 glycol 0.05, and 1,4-butylene glycol 0.80 equiv was treated with
 4,4-diphenylmethane diisocyanate at 1.03:1 ratio NCO/active H at
 70.degree. to give a polyurethane having viscosity 100,000 cP, no.-av.
 mol. wt. 80,000, and F content 11%, forming a film showing tensile
 strength 810 kg/cm2, elongation 350%, contact angle 110.degree. (H2O) and
 68.degree. (dodecane), and Taber abrasion (after 100 cycles under 100-kg
 load) 75 mg. with nonblocking **surfaces** and good dye-mixing
 property vs. 840 kg/cm2, 330%, 78.degree., 12.degree., and 250 mg, resp.,
 with highly blocking **surfaces** and poor dye-mixing, for a
 polyurethane not contg. I.

AB Foam-backed pressure sensitive adhesive tape which is resistant to gasoline and water, useful in automotive applications, comprised an open-cell polyurethane foam contg. a foam stabilizing fluoroaliph. compd. having a degree of compatibility with the foam to offset the insolubilizing effect of the C-F bond and to concentrate the fluoroaliph. compd. at the foam **surface**. Thus, a polyether-polyurethane foam adhesive tape backing contg. 1.0% butyl acrylate-N-ethylperfluorooctanesulfonamidoethylacrylate-poly(oxytetramethylene)acrylate copolymer [61577-17-1] showed a gasoline repellancy of 8.5 min compared with >0.02 min for backing contg. no fluoroaliph. additive, and a similar tape contg. the additive passed the water barrier test.

AB The reaction of bis[(fluoroalkylthio)methyl]methanols (adhesion promoters), obtained from perfluoroalkanethiol and epoxide, with 2,4-toluene diisocyanate gave carbamates useful as **oil** and H₂O **repellent** for leather, textiles and paper. Thus, 0.8% bis[perfluoro(7-methyloctyl)ethylthiomethyl]methyl phenyl 4-methyl-1,3-benzenedicarbamate soln. in CH₃CCl₃ was sprayed onto sueded pigskin to give a specimen with 100+ oil and 100-H₂O initial repellency rating (AATCC Std. Test method 52-1952).

AB The title polymers, useful in **coatings** and **oilproofing** of textiles and leather, are prepd. from polyols contg. perfluoroalkanesulfonamides. Thus, heating N-(2,3-dihydroxypropyl)-N-propylperfluorooctanesulfonamide 86, 2,4-tolylene diisocyanate 48.7, EtOAc 86, and Et3N 0.5 part 2 hr at 60.deg. gives a diadduct. Heating 157.8 parts this compd. and 101.3 parts polypropylene glycol (mol. wt. 2025) at 100.deg. gives N-(2,3-dihydroxypropyl)-N-propylperfluorooctanesulfonamide-polypropylene glycol-2,4-tolylene diisocyanate copolymer (I) [**39387-95-6**], which remains flexible at -70.deg. and adheres well to metals and glass. Cotton **coated** with a 0.8% CCl4 soln. of I and cured 10 min at 140.deg. shows H2O-repellency (AATCC 22-1952) 90 and **oil repellency** 70.

AB Fluorinated polymers are well known as high performance materials due to their durability, surface properties and chem. resistance. In the last years, in order to accomplish new environmental requirements, all efforts tend to develop new application systems based on aq. polymer dispersions or emulsions. New aq. dispersion of fluorinated non-ionic polyurethanes are prep'd. by a step process. In the first step, a fluorinated isocyanate end-capped prepolymer has been obtained by reaction of a cycloaliph. diisocyanate with a fluorinated macrodiol in the presence of solvent. The following chain extension has been carried out by reaction of the prepolymer with polyethylene glycol. Particular attention has been given to both the thermal and surface properties of the polymers and the rheol. properties of their dispersions. These polymer structures show good dispersibility, tunable viscosity of their dispersions, peculiar characteristics of moderate hydrophilicity and oleophobicity. Thanks to these properties this new class of polymeric materials provides new opportunities for the applications in advanced technol. fields.

AB A bicomponent fluorinated polyurethane coating was obtained by crosslinking a bifunctional, OH-terminated perfluoropolyether oligomer with a fluorinated polyisocyanate based on isophorone diisocyanate cyclic trimer. Three different tin contg. catalysts [dibutyltin dilaurate (DBTDL), dibutyltin dimercaptide (DBTDM), and tin octoate (TO)] were evaluated during the crosslinking reaction through gel time measurements and IR spectroscopy at 15-45.degree.C. Both methods showed a substantially higher activity for DBTDL and DBTDM, with TO being almost ineffective (latent) at ambient temp. The spectroscopic measurements allowed the detn. of apparent second-order kinetic consts. of the crosslinking reaction. The activation energies in the temp. range considered were obtained from the corresponding Arrhenius plot, showing a temp. dependence higher for DBTDM than DBTDL (8.5 vs. 7.0 kcal/mol). Finally, the conversion of the crosslinking reaction on a dry polymer film was estd. to be around 60-80% after 8 h at ambient temp. with DBTDM and DBTDL, but only 20-25% for TO-catalyzed reactions. The formation of a hard urethane phase having a glass transition temp. higher than the crosslinking temp. was considered as the main limiting factor of the overall reaction rate.
